

Above is another typical amplifier made by the German trio. This one is a **Siemens KV2** and it is remarkable similar to the Klangfilm. (The Siemens , Klangfilm often were) This one however has resistor loaded anodes. Should you happen to have a pair of RE604's both of these circuits are good candidates for a modern amplifier – a little modification needed of course. The signal filters must go and the signal capacitors, as well as the smoothing capacitors are too small for modern use.
